Preparing Operators for Direct Potable Reuse

Our traditional water supplies are under on-going pressure from droughts and population growth. To relieve some of this pressure, many municipalities are turning to potable reuse to provide a local and sustainable water source.

One option for potable reuse is direct potable reuse (DPR) that forgoes an environmental buffer and therefore carries a potential higher risk to public health and requires increased protection strategies.

This workshop will provide an overview of potable reuse regulations, discuss a hypothetical DPR treatment train, and delve into five unit processes including **ozone, biological activated carbon, membrane filtration, reverse osmosis, and ultraviolet light advanced oxidation process.**

Lunch included. Sign-up soon as there is a reg cap.
This event has a fee. Early bird deadline is March 25.
