

June 22 Dinner Meeting

Valley Water's Advanced Water Purification Facility in Palo Alto

DESCRIPTION

Valley Water is expanding its ability to replenish its groundwater with purified water - a drought-resilient, and locally-controlled water source. Valley Water must meet future water demand and identify a sustainable water supply to combat the effects of climate change. The Purified Water Project will help meet those water supply goals, which includes providing at least 10% of water demand in Santa Clara County through recycled and purified water. The project will allow Valley Water to develop the use of purified water to supplement existing water sources in a manner that minimizes environmental impacts. When completed, this project will result in a facility capable of providing on average 10 million gallons per day of high-quality, drought-resilient water. The project will utilize a Public-Private Partnership (P3) model as a way to deliver this project more cost-effectively.

Schedule

5:00pm Board meeting

5:30pm Social

6:15pm Dinner and Presentation

After Presentation Door prizes!!
